

Vergence, Sentillion's Clinical Workstation solution, consists of various desktop components that will occasionally require updating within the infrastructure. The most efficient manner of distributing these updates is via an automated software distribution package. This is similar to any other patch management process that an organization has in place. By creating a software distribution package, healthcare organizations can streamline the process for rolling out the initial software as well as sending out software updates. This will also allow consistency on your desktop build for the Vergence solution as the packages installed on all desktops will be the same.

The Vergence Desktop Management solution offers assistance in automating your software distribution packages for your Vergence enabled desktops. This solution leverages your existing desktop deployment system by including the Vergence software as part of the distributable packages and will include software packages for the initial desktop deployment, application updates and role-based workstations.

### Services

- Automated Application Deployment of Vergence software
- Process for desktop management for Vergence solution
- Support for Microsoft System Management Server, Symantec's Altiris software, Novell Zenworks and Microsoft Global Policies
- Support for Windows 2000 and Windows XP desktops

### Deliverables

- One Day On-Site session assisting in creating and testing Vergence software distribution packages
- Software Distribution Package for initial rollout of Vergence solution
- Process for desktop management of Vergence solution
- Training on building future packages to support patch management

### Disclaimer

- This program only includes packages for Sentillion Vergence Software
- One of the supported automated software solution must already be implemented and fully functional prior to Sentillion coming on-site
